

X Handle binary data using base 64 encoding

Learn how to insert binary files directly into text nodes of a XML element

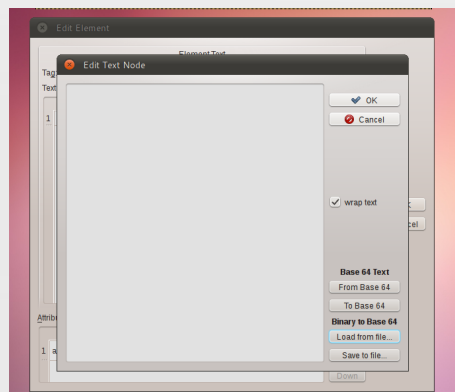

With QXmlEdit you can transform binary data into base 64 coded text and import and export it directly into text nodes of your XML file.

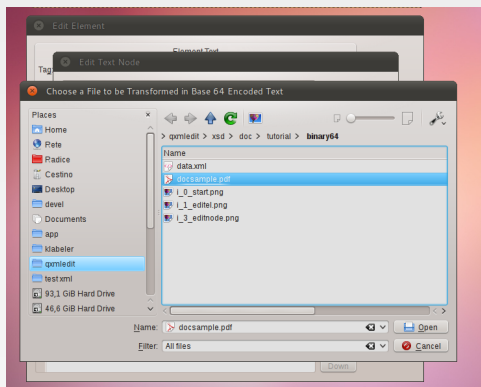

1 Select the element where you want to insert binary data.

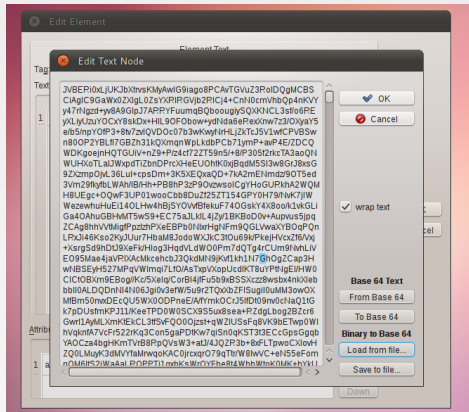

2 Open the property panel of the element

3 Insert a child text node and select "Load from file..."

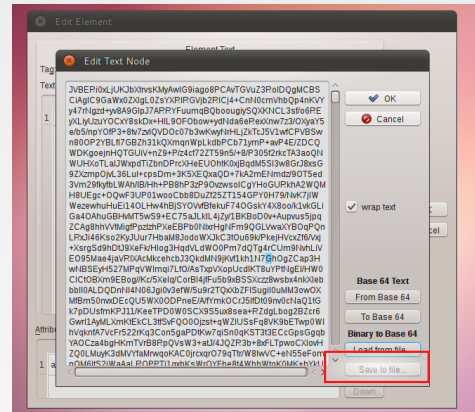

5 Browse to the file

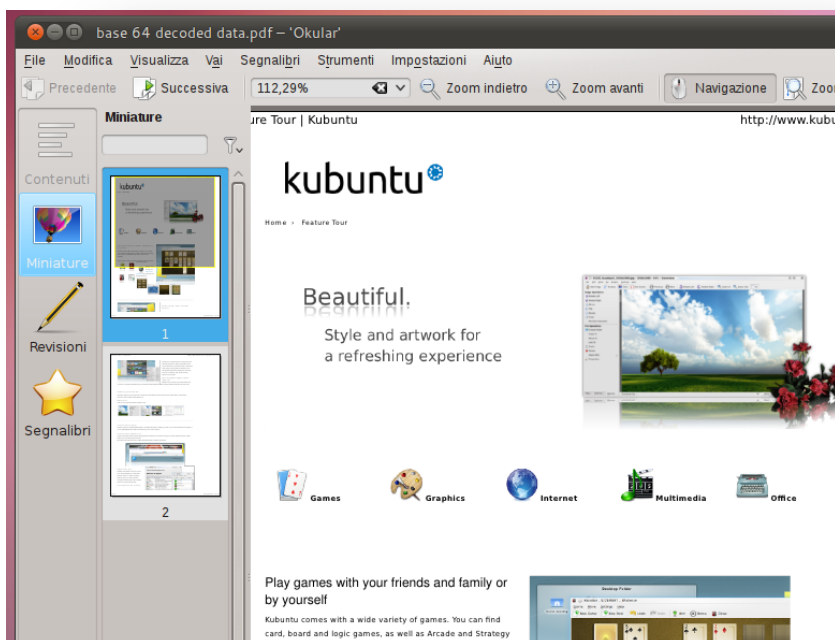

6 Have it loaded

WARNING: wrap text option takes a lot of time with big files!

7 You can export the data with "Save to file" option

Finally you can read your precious data in its original format.
